

THE QUESTION How can Army use AI to increase operational effectiveness?

Army should use AI where it relieves a material constraint on military output in ways that convert into capability.

A small army that cannot fight when the tools are denied has not gained effectiveness. It has moved its dependence.

THE MODEL

The Framework

An application that cannot answer Constraint and Mechanism is novelty. Measure the effect on the output, not the use of the tool.

THE ASSURANCE TEST

Assurance increases with consequence, irreversibility and difficulty of verification

THE IMPLICATIONS

Army People

The Principles

- 1 **Effect first**
Measure Army output, not AI use.

2 **Task before tool**
Start with the constraint, not the technology.

3 **The commander owns it**
AI advises. The commander decides and signs.

4 **Assurance by consequence**
More control where error costs more.

5 **Competence before dependence**
Practise the skill. Never rely on the tool for it.

Priority Actions

- 1 **Own it**
Assign accountability. Set risk appetite by consequence.

2 **Prove effect in three places**
Planning, training design, readiness data. Stop what fails.

3 **Train it through the approach**
Real tasks, tool-denied assurance, instructors first.

4 **Improve the data**
Readiness and training data likely limit the highest-value uses.

5 **Compress the lessons cycle**
Observation to updated training, at a pace the force can act on.
